I clearly understand what you're trying to build because I've tried to build this before. Actually, in 2024, when I was talking about artificial AI... Okay, when I was talking about AI agents in 2024 using NHN, this was the type of system that I was trying to build for my web design agency. Back then, I used to call it Devonly.

This was the type of autonomous system that I was trying to create. So I understand everything that you're talking about. Even one of my app ideas in the app ecosystem that I'm developing for DBNM actually focuses on exactly what you're talking about.

But the thing is, your AI misinterpreted it because it's pre-trained. It's not reinforcement learning with human feedback or machine learning. That's not what it is.

It's called recursive learning. By recursive learning, we're saying that the artificial intelligence system uses its data and the data it's training on to better itself continuously at an exponential rate. But then your system is not necessarily focusing on the underlying mechanisms or mechanics of the AI.

Your system is saying, how do we get the AI to look at a dictionary and make us money? That's what your system is talking about. Your system is essentially like the top layer. But then me, I'm going beyond that and I'm saying the top layer is not that difficult if you really look into systems engineering.

But once we can figure out the underlying architecture of the mechanisms that essentially allow the AI to understand the dictionary, to understand the purpose of the language, to essentially make us rich, that's exactly what I'm trying, that's what I'm seeing in there. And my marketing system and all the other things, inclusive of the creative economy, they all go into this. And the thing is, right now I'm just constrained.

But when I do get an opportunity, we'll put all of this in a document and you absolutely love it. But I see the core idea that you're trying to push. And the flow is that you're kind of focused on one niche.

But I want you to try and think of it like a system that you can throw in any niche, the AI lens, and then give the output. It should be like, how can I say this? Like some sort of harness, like you know how cloud code is just the top layer. But you can essentially use any model inside it.

That's what I want you to ideate the system around. So that once we pitch this first MVP, it may look like a no brainer to say no. Anyone that we pitch, pitch it to.
