

Tab 1

Video Editing Skill Acquisition System

[Click here for Google Doc](#) ([Click File > Make a Copy](#))

Introduction

Welcome to the most strategic **Skill Acquisition System** for video editing you will ever find. We are excited to walk you through the exact **system** that took these people from **zero skills** and **zero network** to commanding upto **eight-figure opportunities**.

This isn't about shortcuts. It's about leveraging **strategic learning** to build a **skill** that billion-dollar **brands** and **top creators** desperately need. Get excited.

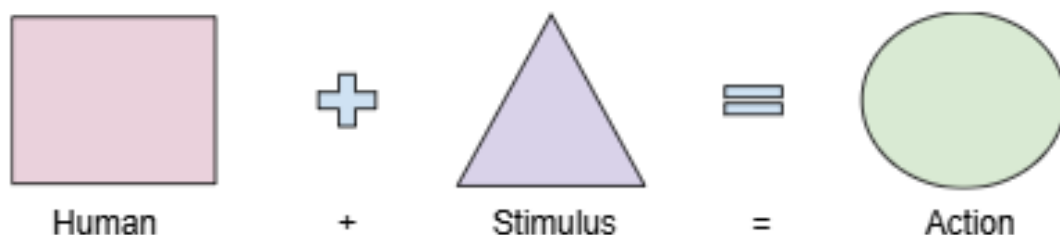

*Before we begin, please note that this **roadmap** is designed to be followed **sequentially**. It's highly recommended that you focus on **mastering** each **stage** before moving on to the next. Do not skip the **first principles**, **psychology principles**, **design principles**..that is where most people fail.*

This is inspired from the **definitive guide** curated by [Somrat Dutta](#) and [Aasil Khan](#), who successfully built an **eight-figure editing agency**. We know exactly what **friction** you are facing, and we built this **module** to eliminate it. You'll be building on a **foundation** of **proven**, real-world **experience**, not just theory.

First Principles

Our **foundational model** is **deterministic**: **Human + Stimulus = Action**.

The entire process of **content creation** is the **systematic engineering** of a Stimulus to trigger a predictable Action in the Human.

- **Human** = A nervous system built for caloric efficiency; a processor of information and emotions constrained by **biological limits** like **working memory** and **attention**.
- **Stimulus** = The combination of sensory inputs (audio, visual, textual) designed to interact with the Human's existing mental models and heuristics to trigger a desired Action.
- **Action** = The psychological or physical behavior you aim to elicit, which is the singular purpose of the Stimulus.
- **Signal** = The precise, predetermined **psychological payload** you intend to transmit, dictating what you want the viewer to **Know**, **Feel** (Emotion), Decide/**Remember** (Memory Encoding), and **Do**.

The Goal of Editing

The singular, non-negotiable objective of editing is to **maximize** the **Signal-to-Noise Ratio (SNR)**.

- **Signal-to-Noise Ratio (SNR)** = The maximization of core information transfer (Signal) relative to extraneous, distracting elements (Noise).

Every element of the final edit is a variable that must either amplify the **Signal** or reduce the **Noise**. Editing is the aggressive **optimization layer** that ensures maximum **action-triggering potency** with **minimum caloric cost** to the viewer's brain.

Here are a few things you need to remember to increase Signal and reduce Noise.:

1. The Signal is the Blueprint

Effective stimuli are always constructed in reverse: you must begin with the desired **Know, Feel, Remember, Do** outcome.

> *What do you want them to know?*

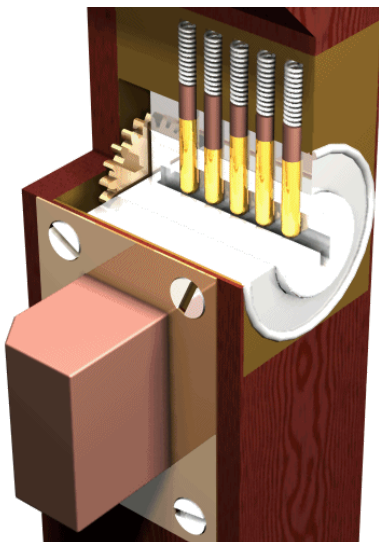

> *What do you want them to feel?*

> *What do you want them to remember?*

> *What do you want them to do?*

This four-part Signal is the **blueprint**, and the entire production chain... from script to final delivery... is merely a mechanism for transmitting this predetermined **psychological payload** to the Human target. Without a defined Signal, the Stimulus is undirected and the resulting Action is random.

2. The Human Mind is the Constraint

Your entire creation is constrained by the **psychological architecture** of the audience. Success is achieved by designing a key that perfectly fits the lock of the human mind.

This means respecting **constraints** such as the **Memory Limit** (the brain can generally only hold four items in working memory)

And prioritizing **Visual Memory** by using concrete words and icons, which are more

easily encoded into **long-term memory** than abstract concepts.

The audience determines the Stimulus, not the other way around.

3. Eliminate Cognitive Friction

All editing decisions must serve to reduce the effort required for the viewer's brain to process the information, thereby eliminating **Cognitive Load**.

- **Cognitive Load** (**Extraneous Load**) = The unnecessary mental effort required by the viewer to parse and understand the content, often caused by confusing design, mismatched **Mental Models**, or non-essential information.

The utility of an edit is measured by the cognitive calories it saves. This involves matching the video's Conceptual Model to the user's pre-existing **Mental Models**. If the experience requires effort to parse, it fails.

CAVEAT: The principles outlined above are essential for maximizing transactional or informational transfer (i.e., making a viewer Know, Feel, Remember, or Do something specific). However, not all content is driven by this utility.

Very few caveats exist where heavy **optimization is unnecessary**, such as:

Raw Content: Content purely focused on **authentic self-expression**, stream-of-consciousness, or the immediate **discovery of truth**. The goal here is not efficiency but sincerity or intimacy. Such content may only require basic structural editing.

Before you touch a timeline, you must first assess the need for editing itself. The ultimate optimization is elimination.

If the goal is educational, every added element... such as diagrams and animated visuals... must be **intentional**, not ornamental. These are not "nice-to-haves;" they are functional components required to overcome known psychological constraints, such as allocating memory resources or minimizing cognitive load.

Videos Requiring Basic or Minimal Editing	Videos Requiring Intentional and Advanced Editing
Raw Content / Vlogs Live Streams & Uncut Interviews Personal Documentation	Educational / Informational Inspirational / Emotional Transactional / Directive

The fundamental guiding maxim for any editor should be: **Eliminate before you optimize** or introduce new things.

The best edit is no edit.

And that ends our first principles section.

Lolapalooza Effects

- It's not the script, edit, color grade, music etc that makes a good video, it's the combination that makes a great video. *Combination.*
- If music fails EVERYTHING fails
- If the script is no good EVERYTHING fails..
- Etc..

Psychology Principles & Design Principles

Mastering the deep and constantly evolving fields of psychology and design is essential for effective video editing, as they govern the entire process of intentional information transfer.

Because understanding psychology and design is basically understanding the lock.

Without a foundation in both, achieving true mastery is impossible. Due to the sheer scope of these domains, a full education is beyond this document's capacity.

To build your expertise, refer to the following critical resources:

Design Resources (Notes)

- [100 Things A Designer Needs To Know About People](#)

Psychology Resources

- [Asymmetric Psychological Leverage](#)
- [The POWER Copy Process](#)
- Additional Psychology Books:
 - [Thinking, Fast and Slow](#)
 - [Influence](#)
 - [Evolutionary psychology](#)
 - [This is marketing](#)
 - [Take their money](#)
 - [Behave Robert Sapolsky](#)
 - [Affective Neuroscience](#)
 - [Etc](#)

Full Roadmap

Before you edit a single clip, you need to understand the Full Roadmap. Every successful editor moves through three distinct levels level. This is your mental model for self-assessment and structuring your practice.

We need to build the foundation first. We'll break it down step-by-step.

- **Beginner Stage:** This is where you learn the core technical skills. You must grasp cutting, beat matching, and basic color correction. Without these fundamentals, your work will feel amateur.
- **Intermediate Stage:** Here, you develop professional polish. This involves music & stems-based editing, basic animations, sound design, and color basics. Your goal is to make videos that look and sound professional.
- **Advanced Stage:** This is the high-value layer. You distinguish yourself with sophisticated motion design, VFX, and compositing. Mastering this is how you command the eight-figure job offers.

Stage 1: Foundational Resources

It's highly recommended you build a strong foundation before jumping into software. Don't skip these essential learning resources. We've curated these to span from basic software navigation to advanced effects and animation.

Software Basics (The must-watch channels to get started):

- [Envato Tuts+](#)
- [Premiere Basics](#)
- [After Effects Basics](#)
- [DaVinci Resolve Basics](#)

Intermediate to Advanced Editing (Refine your craft):

- [Olufemii](#)
- [Predittut](#)
- [Film Editing Pro](#)
- [Tiny Tapes](#)

Effects and Templates (Learn how to create visual impact):

- [Naughtyy Juan](#)
- [Hobo Edits](#)
- [FKFLBY](#)

Deep Dive into Specialised Skills (This is how you elevate your editing prowess):

- Color & Filmmaking: [Color Grading Central](#), [Aidin Robbins](#), [Trentorials](#)
- Sound & Motion: [Mike Russell](#), [Ben Marriott](#), [Motion XP](#), [Motion Nations](#), [Motion Designer](#), [Stephan Zammit](#)
- Animation & 3D: [Alex Grigg Animation](#), [CG Geek](#), [Eyedesyn](#)

Stage 2: Core Competence

This is a critical pivot point. Eighty percent of exceptional video editing hinges on strong design principles, not just your speed in the timeline. You must cultivate your design eye first.

Before diving into complex editing suites, you need to master visual hierarchy. If the design is weak, the edit will be weak. Period.

Photoshop Essentials:

- Mastering Cutouts
- Applying Textures & Overlays
- Crafting Paper Rips
- Graphic Preparation Techniques

Illustrator Fundamentals (Working with Vector Assets):

- Designing Shapes
- Creating UI Layouts
- Developing Icons
- Utilising Vector Assets

Stage 3: Choosing Your Arsenal

Do not try to learn every piece of **software** at once. Your goal is to select **one primary editing application** and **one motion graphics tool**. Focus your **learning journey** to build **expertise fast**. This is your **recommended setup**. This is what the **industry uses**.

Recommended Industry Standard Setup:

- **Editing:** **Premiere Pro**
- **Motion Graphics:** **After Effects**

If budget is a concern, we have powerful, **free alternatives**. Remember, the **principles matter** more than the **tool**.

Free Setup (Budget-friendly powerhouses):

- **Editing:** **DaVinci Resolve**
- **Motion Graphics:** **Fusion** (integrated into DaVinci)

Stage 4: Defining Your Niche & Proof

Your **career growth** is directly tied to the **style** you become known for. You must **experiment broadly** until your **unique voice** emerges.

Step 4: Find Your Editing Style.

Finding your **niche** is **crucial** for **sustained growth** and **recognition**. This is what will **differentiate you** in the market.

Niche Options (Where you can dominate):

- **YouTube Explainers**
- **Fast Reels for Social Media**
- **Documentaries**
- **Corporate Videos**
- **Motion Design Breakdowns**

Once you have your **style**, **Step 5** is to Create an **Irresistible Portfolio**. Your **portfolio** *is* your **professional identity**. This is what I used to generate **high-value opportunities**. Curate **5-7** of your **absolute best projects**. Remove anything that is merely **average**. Showcase **high-quality, consistent work**.

Recommended Portfolio Tools (Build a clean, high-agency presence):

- **Bento**
- **Framer**
- **Card**

Stage 5: High-Value Acquisition & Leverage

Now it's time to move toward **client acquisition** and **scaling your output**. We'll cover two **paths** for **Step 6: Secure Your Clientele**. You need to **choose the right path** for your goals. This is about being **strategic**.

Client Acquisition Paths:

- **High-Volume** & **Credibility**: **Platforms** like **Fiverr** and **Upwork** for **quick results** and **proof**.
- **High-Value** & **Long-Term**: **Building a personal brand** on Instagram or YouTube for **higher-paying, long-term engagements**.

Finally, **Step 7** is how you stay ahead: Harness **AI for Efficiency**. The **future of editing** involves **maximum leverage**.

Integrate **AI tools** to **amplify your capabilities**. This is what separates the **elite editor** from the **average one**.

Key AI & Efficiency Tools:

- **Generative AI**: **Freepik Spaces**, **Midjourney** (for **assets** and **visual concepts**)
- **Text-Based Editing**: **Descript**, **Premiere's text panel** (to **streamline your workflow**)

INTERMEDIATE

AI + Editing

There's a thing called programmatic editing, which does the beginner level edits with AI

<https://www.youtube.com/live/hTgc49JzjO0?si=4ngmqbosRNAbsONE>

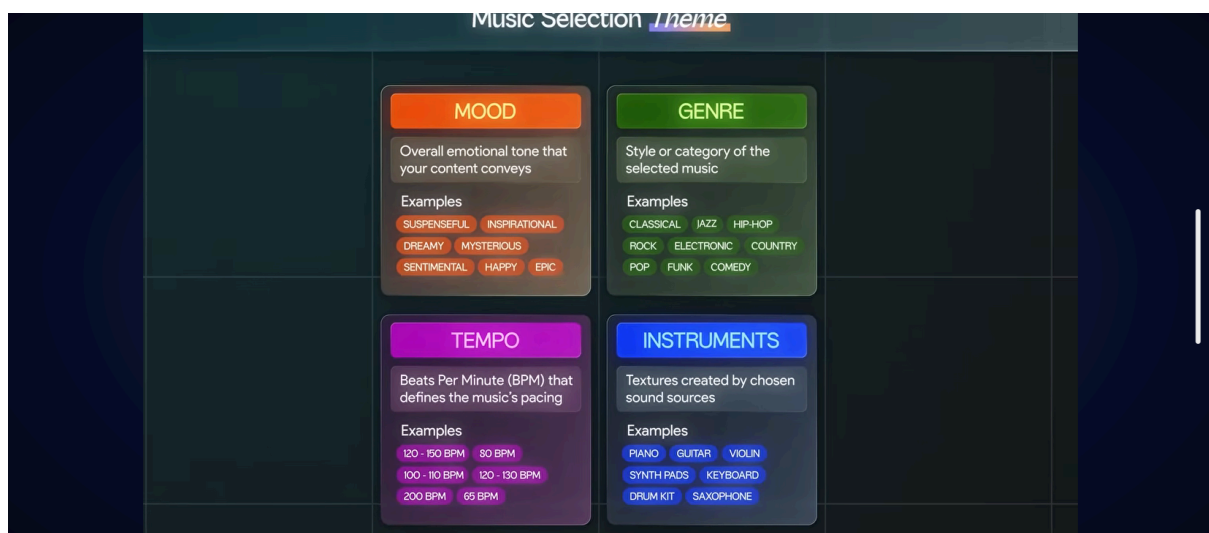

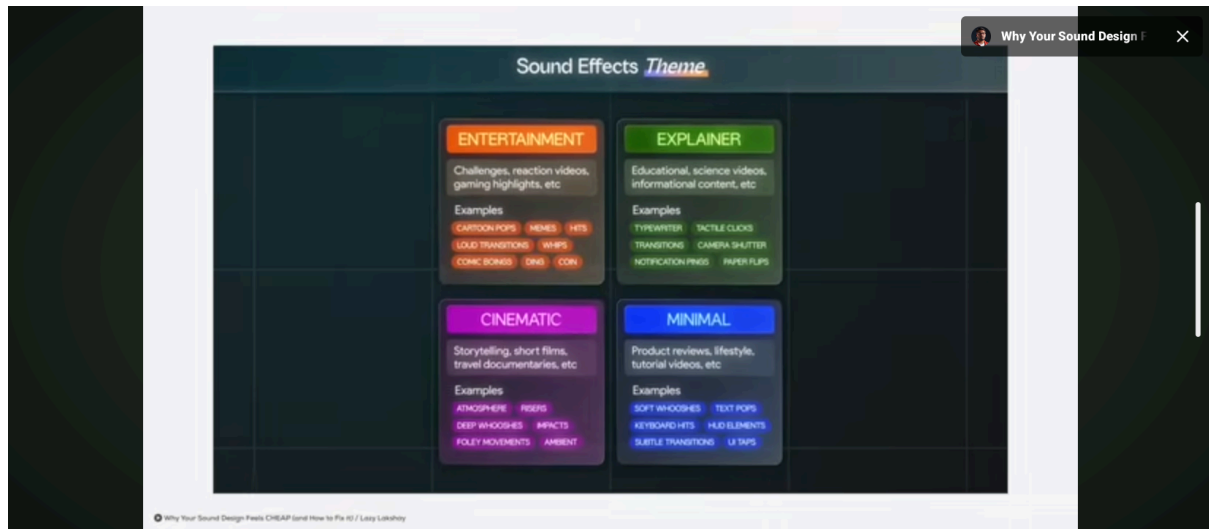

Music In Editing

Keyframe the music

Avoid music carpeting

Goal : The music should not sound abrupt

To not make music abrupt, you need to choose the theme first, and stick to music in that theme of the video

📺 No one tells you this about MUSIC in editing.

Find your music along with scripting, that way you can record with keeping the music in mind

If you are talking about something serious, no adding music is better.

Stop the music at the peak when you want to empa

ADVANCED

Mental Mapping

Insights i got after watching this video:

▶ Best Skill to Learn in 2026 (AI Can't Replace This)

1. When describing something technical, you need to have a base background like a dark bg or a bg with minimal graphics and then the assets you want to show, then you can fade in and out these elements
2. Add pauses between sentences, split the gaps between sentences and slow it slightly.
3. You need to bring the symbols and ideas that are salient in the mind of the target avatar
4. The words that pack emphasis can have a fast cut b roll
5. When there is something important, cut zoom in
6. The speed of cuts are based on the words per minute and excitement of the creator
7. When uncovering something, use a intriguing curious, and playful like bgm going in the background
8. Use click sounds and cam click sound when elements are appearing in screen
9. Also B rolls can have sound effects, lie=ke if pages turning, page turning sound, if there is a car, car speeding etc.

Now i have my ideas as well. I need to have a 10 second montage like video of someone speaking to AI vibe coding, going to files, moving from files to files, buidling things clicking keyboard, chajning apps, t=it should start slow and as each second goes on the cuts become fast the beat of the video, background beat becomes fast anbd the cts change between the coder's eyeys, srceen, movise, keyboard etc. Re do the b roll paylaod.

B Roll Payload Prompt

Add pauses between sentences, split the gaps between sentences and slow it slightly.
You need to bring the symbols and ideas that are salient in the mind of the target avatar
The words that pack emphasis can have a fast cut b roll

When there is something important, cut zoom in

The speed of cuts are based on the words per minute and excitement of the creator

When uncovering something, use a intriguing curious, and playful like bgm going in the background

Use click sounds and cam click sound when elements are appearing in screen, Also B rolls can have sound effects, like if pages turning, page turning sound, if there is a car, car speeding etc. --- these are the changes i would like to have now re-read the transcript and help me design the b rolls intentionally. The b rolls donest need to be movie focused for the most of the time, it can be stock, but the choice, pacing and timing is matters, go micro to macro and group different types of b rolls, don't dismiss anything bring the movie footage, bring the stock b rolls, the explaining background and items etc for each section, and also bold and uppercase the power words and mention the name of b roll needed to be used there as well. (MAKE SURE THERE IS METICULOUS TIMESTAMPS, IF YOU CANT GENERATE IN ONE RESPONSE, WE CAN DO PART BY PART AND TAKE YOUR TIME. DONT EXPLAIN THINGS ONE SENTENCE THEN WHITE SPACE ANOTHER SENTENCE PROPERLY EXPLAIN THINGS IN 2 FULL SENTENCES THEN WHITE SPACE ETC ECONOMICALLY USE BULLETS AND NUM LISTS. GIVE EXACT TIMESTAMPS FOR EVERYTHING. EVERYTHING. EVEN POWER WORDS. EACH SECTION NEEDS TO HAVE CURATED MOVIE B ROLLS, STOCK B ROLLS, POWER WORD B ROLL COMBO. LEAVE TECHNICAL EXPLANATION FOR NOW. calculate WPM based on number of words between timestamps. Also show that for each stage and different part of the thing and maintain a modular structure. You have to bring the 3 types of b rolls to the editing table for each section and also make sure that you insert these b rolls inside the transcript parts. in "[]" You have to cover the entire transcript. When you are inserting the b rolls, you can make notes inside "[/]" as what is intended here and what the end we are trying to accomplish and how it connects with the previous b roll payload etc. YOU HAVE TO COVER THE ENTIRE SCRIPT, YOU HAVE TO MAKE NOTES ON EVEN THE PARTS WHERE THERE ARE NO B ROLLS. Everything should be neat. HERE IS THE TRANSCRIPT WITH TIMESTAMPS: "(0:07) Today we're going to talk about why nobody cares about my AI app, maybe yours too. (0:11) You see all these people telling you to build an AI app to fast track your way to 10k a month, (0:20) but after you build an app, you launch it, nothing happens. (0:24) You know the reason why, lack of distribution, lack of eyeballs, nobody's seeing your stuff.(0:30) You're not getting blown up, you're not getting views, that solution, views from the right (0:36) people. (0:36) You don't need a million views, but you need the views from the right people. (0:40) You are not getting in front of the right people.(0:45) So I ask myself, if creating an app has a roadmap, like learn code, learn AI, learn everything, (0:54) would creating distribution has a roadmap? (0:57) Because I never seen any kind of roadmap for building distribution. (1:01) I've seen many creators like Varun Maya, like Yas, and many other agencies and stuff building (1:09) systems and all that, but I don't know, I'm not sure like content is also engineered like (1:16) software and apps, and it's not as easy as building an AI app. (1:25) That is the reason why people are not able to sell the things that they create because (1:32) it's hard to create trust, and it's hard to grab attention.(1:39) So attention and trust are the most expensive current things in the world. (1:45) Not building software, because nowadays building software, building stuff, it's easy now. (1:54) So I was thinking like, so there's like apps that helps you to create, increase the speed (2:01) of

software development, like cursor, like cloud code, like anti-gravity.(2:07) I was thinking of creating some kind of an interface that would allow me to do that, but (2:13) not with building apps, but with getting distribution. (2:18) I was thinking, okay, what are the different parts of the system that I need to optimize (2:25) to get that output? (2:27) Because nowadays with AI and with enough like really good execution and really good context (2:33) engineering and harness engineering, you can actually pull that out. (2:38) I think so.(2:41) I'm not talking about building a content system with AI, I'm not talking about that. (2:46) I'm building, I'm trying to like basically download the brain of like Alex Formosi's content (2:55) team, Varun Maya's content team, and Gary Vaynerchuk's content team to an AI and letting (3:03) it judge how good each things are to making sure that it's actually achieved the output. (3:14) I mean, it sounds like you can pull it off.(3:17) It's like easier said than done. (3:19) Like it's really hard to figure out distribution. (3:21) Like it's really hard to get even a hundred views, a thousand views, right? (3:26) Talking about millions, it's really hard.(3:30) So it's not as easy as it sounds, and I think I'm being too optimistic here. (3:37) I am not sure like whether distribution can be engineered like that. (3:41) I mean, Varun Maya seems to do that well, their content team is like huge.(3:47) One person with AI can do that, I'm not sure. (3:54) But I really believe in what Elon Musk says, which is basically think from first principles (4:00) and build things like that instead of like thinking that, OK, with others think this (4:06) will not work, you should not also think that it will not work. (4:11) You also have to think in first principles instead of thinking in analogies.(4:18) I'll show you a diagram that helps you visualize that. (4:23) It really helps me to look at it like this. (4:26) So on like this is you, right? (4:30) You are sad because you are not achieving your goal for some reason, right? (4:36) You want to achieve your goal, but you are not able to, right? (4:40) There's path along this path here, right? (4:44) This like usually you start out like this.(4:47) You don't know the problem. (4:48) You don't know the solution. (4:50) It's confused.(4:50) You are just confused. (4:52) You don't know how to interpret the problem. (4:55) You don't even know whether a problem exists.(5:01) Then you kind of understand solutions. (5:04) You kind of OK, I need this thing. (5:08) I kind of understand the solution now because I just exposed myself to enough content (5:13) that helped me to solve that problem.(5:17) Maybe you read books, maybe you learn from experience, maybe you watch YouTube videos. (5:22) I don't know. (5:27) And then finally, this is the last layer of insane level of understanding.(5:33) And they reached out to solve any problem, right? (5:36) That comes from the sort of thinking that there are people called first principles thinking. (5:43) So every solution that helps you go forward to your goals (5:50) comes from a sort of a group of tactics, right? (5:55) And these tactics come from first principles. (5:59) So first principles create the tactics.(6:03) The tactics create the solution. (6:06) So you must understand that a solution that works today (6:10) may not work six months from now. (6:13) Like building an agent automations were a thing last year.(6:18) But this year, that is not as good of an opportunity. (6:24) So that solution to get to your goal, maybe you want to learn AI, maybe you want monetize it. (6:31) That solution won't work because the tactic has changed, which is to learn a specific thing.(6:39) Because that is coming from a first principle called supply and demand, right? (6:44) When the technology changes, when evolution happens, (6:48) evolution is also another first principle. (6:51) Evolution happened in the market. (6:53) So better tools came like Claude.(6:56) Because of that supply of, I mean, supply of Claude, like tools like Claude increases, (7:02) demand of, you know, demand for like in an automation might have decreased maybe. (7:07) Like I'm just giving an example here, right? (7:10) So because of the reason the tactics change, (7:12) because of that reason, the solution changed. (7:15) So if you only think in one dimension of the solution, you will get confused like this.(7:22) I

hope this is making sense, right? (7:25) So that is the kind of thinking I like to use when building the influence accelerator thing, (7:31) the, you know, code for distribution, if you will. (7:37) Let me just show you the actual first principles and tactics and solution layer (7:42) of influence accelerator itself. (7:46) So you will get more clarity of what I'm talking about. (7:51) This is the influence accelerator, you know, obsidian, right? (7:58) Obsidian world, where I build this system or this harness, (8:04) this context engineering or prompt engineering and this AI system, (8:08) AI infrastructure for content, for distribution, right? (8:15) So let's start from the first principles. (8:17) Let's start from the bottom, right? (8:20) Like the first principles thing. (8:22) First of all, it's mathematics. (8:23) So if you think like everything has a conversion rate, right? (8:30) So you might know if you were familiar with marketing. (8:33) So if 100 people, if you call 100 people, (8:36) five people might give you a positive reply. (8:39) So that's 5% positive reply rate. (8:42) That is math. (8:44) So if you increase the scale volume, you know, like metric also improves, right? (8:52) So if you're thinking that kind of reverse engineered math (8:57) and a lot of things will become easy to do, right? (9:01) Then physics, right? (9:03) Physics can be like, okay, if you increase the confidence of your, (9:09) you know, sales message, people might, you know, like resonate more, right? (9:14) Something like that. (9:15) Or like you drive traffic from YouTube to Instagram. (9:19) That is like people moving from one place to another digitally. (9:22) That can be interpreted as physics. (9:25) Like all of this kind of makes, it kind of doesn't make sense. (9:31) And it kind of seems nerdy right now. (9:34) But when all of it comes together, it works, right? (9:39) So then it's like principles, like there's principles of psychology, (9:42) which is the one that makes most sense here. (9:46) Like there's one principle called like reciprocity. (9:50) Like we like to give to people that gives us something that is a principle. (9:55) Like all of these principles, that's the reason why you like some influencers (10:00) or something like that. (10:01) I can just say that, right? (10:03) So that is the first part, principles. (10:05) From these principles comes, you know, platforms. (10:11) Like just below about the principles, there are platforms, right? (10:14) We are executing the principles inside these platforms. (10:18) So these platforms are specific rules, like specific types of content (10:21) that we can post. (10:23) Instagram has reels, carousels, and there are multiple types of carousels (10:26) and reels that you can post. (10:30) And based on the principles and the platform logic and your avatar, (10:38) your personality, you can make sure you post a certain type of post (10:43) that has the highest chance of converting and that do not look like AI swap. (10:49) Most importantly, right? (10:51) So if you want to generate impressions, more views, more, you know, like (10:55) likes, more conversions, the entire system is trying to optimize to that. (11:02) Your goal, right? (11:03) That's what we're building here. (11:05) Then the third things are tactics itself, right? (11:08) So what are our what are our tactics? (11:11) Is it like, you know, sending, you know, the resources through many chat (11:18) or is it like creating an AI series? (11:22) What makes sense to this audience? (11:25) The most like the AI will figure all that out. (11:28) You know what I mean? (11:30) This is what I meant, right? (11:33) I will figure out the tactic from thinking from the first principles. (11:37) It will automatically figure out the tactics with the given input (11:41) of what kind of client you are serving, what niche they are in, (11:45) like what they want to accomplish. (11:47) The solutions will be created by AI and the client or you just have to walk (11:52) it, walk that, you know, thing. (11:55) I think this is making perfect sense here. (12:01) There are many agents that does the production, which means the scripting, (12:05) the, you know, all of that stuff, the editing, all that. (12:09) And then pre-production, post-production, which is the editing of video editing, (12:13) actual editing, using poor plug-ins and making sure that it's actually advanced, (12:18) not some generic editing, right? (12:22) Obviously, like there's needs to

be a human touch there. (12:24) I'm not denying that, but there will be one where that is not needed, I think.(12:32) So we are building towards that, I guess, and then deployment. (12:36) Like there, there are particular times where like posting is the best time. (12:41) There are best times for posting.(12:44) That's another thing. (12:46) OK, so this is what we are building, right? (12:51) So how I build it is basically I read books. (12:53) I will consume courses.(12:55) I build just theory craft and put it into the sources and try to like, you know, (13:01) build this, build this reasoning, right? (13:04) With the reasoning of like the first principles, tactics and solutions (13:07) to the point where the AI can now build the tactics and solutions by itself. (13:14) You know what I mean? (13:15) We feed the tactics and solutions that work and then AI will figure out new ones (13:20) based on the changing environment. (13:21) This is very abstract.(13:23) I guess this makes sense, right? (13:25) If you're watching this video till this point, I really, really want to work with you, I guess. (13:31) I thought it was all about building an app and like just building something valuable (13:36) and putting it in front of people, like putting it in front of people is more important (13:41) than building the thing. (13:42) That's what a lot of people don't realize, especially the people who says like, OK, (13:48) you need to build, build, build, build, build.(13:49) But building is just a part of the puzzle, right? (13:54) Distribution is the most important thing. (13:57) So I don't know whether this thing can be executed to its potential, (14:02) but I'll try to do that and I'll keep you guys posted. (14:06) So, yeah, thanks for watching and consider subscribing."

Tab 6

IA: Intervention, there should be a 'personality' file for the client by which all of this, taste and everything is loaded in such a way where the video gen model has a theory of mind that would execute the small quirks and whatever of the client, and their specificity.

IA should have an auto research agent which surfs through YouTube videos about design, video editing, scripting etc and creates two files.

1/ the Google doc for the humans to understand (gemini)

2/ .md file for the AI to understand

TO AVOID AI GENERALIZATION, I NEED TO MAKE SURE OF THIS BECAUSE THE AI OUTPUT WILL BE SKEWED TO THE MEDIAN.
