

CEA Information Architecture v1 (Draft) - Aug, 04, 2026

NOTE: Please understand that this is an MVP version and this is a draft of the information architecture. This is not the final version, and please do not base any final judgments on this. You can definitely comment and suggest improvements in every area; that is really appreciated and truly needed. I don't think this system is nearly enough. The money is in the details... in the execution of how this system operates and how accurate its output is. The architecture is just one part of it. The information we input, the congruence of the entire system, and how truthful and reliable the system itself is, are the most important things. I created this information architecture just for the purposes of creating a UI/UX demo to prototype that aspect as well. After this, I'll go back to building the backend, mechanisms, systems, prompts, fine-tuning, research, and everything else.

 R&D

Layer 1: Conditions (The Inner Layer)

The 28 Avatar Psychographics

To craft the perfect key (copy) for the lock (the reader's mind), you must first understand the lock in excruciating detail. These 28 traits form the raw material for the Avatar:

Trauma
Obstacles/Problems
Age
Doubts
Goals/Dreams
Fears
Insecurities
Vices/Addictions
Thinks About
Beliefs
Identity
Emotional Patterns
Resentments
Role Models
Guilts/Shames
Media
Platforms
Routines/Habits
Family/Relationships
Purchases
Health
Traits

Values
Education
Social Life
Hobbies
Work Experience
Finances

Core Logic of Layer 1

Layer 1 is the foundational psychology of persuasion, modeled as the "Lock & Key" framework. The reader's mind is the lock; the copy is the key. To craft the right key, you must deeply understand the lock. The core mechanism driving human behavior in this layer is The Action Equation:

$$[\text{Pain of Inaction}] - [\text{Pain of Action}] + [\text{Confidence in Action}] = \text{Chance of Action}$$

$$[\text{Pleasure of Inaction}] < [\text{Pleasure of Action}] + [\text{Confidence in Action}] = \text{Chance of Action}$$

Action occurs when the pain of staying in the current state is greater than the perceived pain/effort of taking the new action, and the prospect has high confidence that taking the action will actually alleviate their pain.

Deterministic Rules (The KJ Modules)

 1. Specific Conditions (YT)	17-Jul-26 09:40 AM
 2. Text-Subtext (YT)	17-Jul-26 09:41 AM
 3. Liking-Relatability (YT)	17-Jul-26 09:41 AM
 4. Pain-Confidence (YT)	17-Jul-26 09:41 AM
 5. Problem Chains (YT)	17-Jul-26 09:41 AM
 6. Urgency-Scarcity (YT)	17-Jul-26 09:41 AM
 7. Concise-Curiosity (YT)	17-Jul-26 09:41 AM
 8. Synthesis (YT)	17-Jul-26 09:41 AM

Module 1: Specific Conditions The Law of the Lock: You cannot write effective copy ("the perfect key") without first understanding who you are writing to ("the lock"). A key that works for one lock will fail on another.

Effective copy targets the specific conditions shared by the largest portion of the audience, rather than hyper-niche anomalies. Condition Potency: The power of copy comes from targeting the few conditions that carry the highest emotional charge, not a laundry list of weak conditions.

Module 2: Text-Subtext The Principle of Pain Awareness:

Humans are always in some form of pain (traced back to Maslow's hierarchy of needs) but are often unaware of its exact origin. The copywriter's job is to bring awareness to this pain and "blame" it on a specific problem the product solves.

Module 3: Liking-Relatability Confidence in You/Client: Establish trust through Variables of Likeness, storytelling, and high specificity.

Module 4: Pain-Confidence Value Relativity: Value is not inherent; it is created in the mind. A solution's value is directly proportional to the intensity of the pain it solves for that specific individual's current level of life.

Module 5: Problem Chains Confidence in the Solution (Problem Chains): Build a logical bridge proving the product is the only way to solve their pain.

Map the Problem Chain: Core Desire -> Big Problem -> Problem Fractals -> Unique Mechanism -> Sub-Mechanisms. By showing how your Unique Mechanism specifically attacks the root cause of their pain, taking action becomes the most logical and emotionally necessary step.

Module 6: Urgency-Scarcity Sequential Value Creation: You must sell the audience on the problem before you can sell them on the solution.

Module 7: Concise-Curiosity Decrease the Pain of Action (The Friction): Leverage "General Conditions" (humans want to conserve energy). Frame the solution and the action required as "New, Easy, Safe." Make the path to solving the problem seem simple, fast, and painless.

Module 8: Synthesis To trigger the Action Equation and generate a conversion, Layer 1 maps these variables through a step-by-step psychological sequence:

Increase the Pain of Inaction (The Pressure)

Decrease the Pleasure of Action (The Incentive/Alignement)

Decrease the Pain of Action (The Friction)

Build Confidence in Action (The Belief)

Destroy Confidence in Inaction (The Anti-Belief)

Layer 2: The Judgment Layer Synthesis

1. The Core Architecture: From "What" to "Why"

In the Influence Accelerator system, Layer 1 represents the raw data extraction and initial conditions: the Avatar's stated demographics, explicit pain points, market behaviors, and surface-level desires (the "What").

Layer 2 (The 16-Level Schema) is the Judgment Layer. It acts as an ontological stack of human motivation. It translates the shallow data of Layer 1 into deep, multi-dimensional human drivers (the "Why"). By passing a Layer 1 condition through these 16 filters, the AI reconstructs the Avatar not as a "consumer," but as a complex biological, psychological, and cultural organism.

2. Mechanism of Mapping Layer 1 Conditions to Layer 2

When the AI receives a Layer 1 condition (e.g., "The Avatar struggles to scale their business and feels burned out"), it runs a vertical traverse through the 16 levels to map the unseen forces at play:

The Biological/Evolutionary Base (Levels 1-4): The AI translates "burnout" into homeostasis failure (L2), cortisol overload (L2), and threat detection in the amygdala (L4). It recognizes that the Avatar's inclusive fitness and status (L1) are under attack, triggering the PANIC/GRIEF and FEAR affective systems (L3).

The Psychological/Cognitive Middle (Levels 5-8): The AI maps the Avatar's business struggles to cognitive depletion (L5) and an attack on their self-efficacy and identity (L6). It examines how this burnout threatens their secure base and pair bonding (L8), isolating them from crucial instrumental support (L7).

The Social/Cultural Upper-Middle (Levels 9-13): The AI frames the business failure as a loss of relative position and dominance (L9). It evaluates the Avatar's fear of social exclusion from their professional tribe (L10) and the loss of social capital and authority (L13).

The Ideological/Philosophical Pinnacle (Levels 14-16): Finally, the AI elevates the problem. The burnout is a crisis of meaning (L15). It threatens the Avatar's legacy, agency, and ultimate human flourishing (L16).

3. Forming Positioning Hypotheses

Once the AI has mapped the Avatar across all 16 levels, it uses this matrix to generate Positioning Hypotheses. It looks for the "White Space" in the market by anchoring the product to a specific, under-leveraged level.

Hypothesis A (The Primal Angle): Anchor at Level 3 (Affective Systems) and Level 9 (Social Dynamics). Position the product as a weapon for dominance and status preservation. Message: "Crush the competition and eliminate the stress that is destroying your body."

Hypothesis B (The Tribal Angle): Anchor at Level 10 (Group Dynamics) and Level 11 (Communication). Position the product as the key to ingroup belonging and signaling. Message: "Join the elite coalition of founders who have cracked the code to scale."

Hypothesis C (The Transcendent Angle): Anchor at Level 16 (Philosophy/Ethics) and Level 6 (Psychology). Position the product as a tool for achieving the Good Life and fulfilling one's ultimate potential. Message: "Reclaim your freedom, build your legacy, and restore order to your chaotic life."

The AI selects the optimal hypothesis by judging which level currently holds the most unreleased tension for the Avatar, and which level competitors are currently ignoring.

4. Deciding How to Elicit Action

To trigger a conversion event, the AI must overcome the Avatar's inertia. It uses the 16-level schema to calculate the precise combination of triggers required to elicit action:

Dopaminergic Seeking (L3/L4): The AI crafts the marketing narrative to trigger the SEEKING system and Reward Prediction Error, promising novelty and resource acquisition.

Uncertainty Reduction (L5): The AI structures the offer to reduce cognitive load and bypass confirmation bias, using heuristics and clear mental models to make the buying decision feel safe.

Status & Reciprocity (L9): The AI introduces social proof, authority, and scarcity to tap into the Avatar's evolutionary drive for relative position.

Moral & Identity Alignment (L14/L16): The AI frames the purchase not as a transaction, but as a reaffirmation of the Avatar's identity and values. Buying becomes a virtuous act of self-actualization.

Conclusion: The 16-level Human Sociality schema gives the Influence Accelerator an unfair advantage. While standard marketing AI optimizes for clicks using surface-level A/B testing, this Judgment Layer allows the system to engage in Deep Emulation. It anticipates how an Avatar will feel, think, and act because it understands the entire biological, psychological, and sociological stack that governs their existence. It doesn't just sell to a persona; it influences a human organism.

Layer 3: The Taste Layer Synthesis

1. The Metaphysics of Marketing (The "Taste Layer" Philosophy)

Marketing is Quantum, Not Linear: Buying decisions are not mechanical, predictable chains of events (e.g., Click -> Opt-in -> VSL -> Buy). They are chaotic, influenced by untrackable life experiences, arguments, insecurities, and timing. You cannot control the system's outcome; you can only control the Impact of Message × Frequency of Message.

Marketing is Energy Manipulation & Belief Shifting: Products don't matter; they are merely vessels for feelings, desires, and identities. True marketing is the manipulation of human energy (Love, Materialism, Sex, Self-Preservation, Freedom).

The Taste Layer weaponizes cognitive dissonance—forcing a prospect to confront the painful gap between their incorrect beliefs and their desired reality.

Reason is a Social Construct: Human reasoning evolved not to find objective truth, but to justify intuitions, win arguments, and build social consensus (The Enigma of Reason).

People buy on visceral intuition but need easily communicable reasons to justify their choices to others.

Pattern Recognition & Epistemology: Markets process information differently. "IQ" in marketing translates to pattern recognition and cognitive load. Furthermore, different demographics operate on different epistemic foundations (e.g., many audiences rely on Empiricism/Observation rather than Rationalism/Mechanism).

A marketer must see reality closely to produce outcomes, meaning they must meet the market exactly where it is, often catering to low-friction, experiential processing rather than complex logic.

2. High-Level Principles of the Influence System

Total System Optimization (The Lollapalooza Effect): The effectiveness of a stimulus (video, funnel, copy) is determined by the interaction between its components, not the components in isolation. Optimizing a single element (e.g., a "better" song or a "cooler" edit) while the overall transmission worsens is a system failure.

Signal vs. Noise: The sole goal is the transmission of the intended psychological payload: what the viewer must Know, Feel, Remember, and Do. Anything that consumes attention, emotion, memory, or cognitive load without improving this transmission is Noise.

Incongruence as Attention: Attention is earned by bypassing expectations ("X is expected, but Y happens"). The brain is a prediction machine; breaking those predictions with extreme takes, sensationalism, or unexpected relatability releases dopamine and forces attention.

3. Nuanced Decision-Making Nodes (Execution Logic)

Signal Ownership: At any given micro-moment, only one component (Narration, Visuals, Music, Sound Design, Text) can be the primary Signal Carrier. All other layers must be subordinate and supportive. Music is not the goal; it is merely a lever to enhance the stimulus.

Dynamic Trajectory Mapping: The Taste Layer does not view a video statically. It maps dynamic trajectories across the timeline: Knowledge Trajectory, Emotion Trajectory, Memory Trajectory, Action Trajectory, Cognitive Load Trajectory, and Stimulation Curve.

Cognitive Load & Pacing: Decisions about pacing and silence are psychological, not auditory. The Taste Layer asks: Where is information dense? Where are they confused? Where must silence exist to let a realization sink in?

The LBC Framework (Lead, Body, Close):

Lead: Slam on the brakes. Must be original, visceral, and sensational enough to pierce the Overton Window of modern noise.

Body: Build the bridge across "The Gap." Introduce the problem, shatter the incorrect belief, and twist the knife into their insecurities.

Close: Do not use fake urgency. Offer the inevitable, logical salvation to the tension you just built.

4. Conflict Resolution: Bridging Layers 1 & 2 via Pain vs. Confidence

The Taste Layer acts as the ultimate arbiter between raw data/research (Layer 1) and mechanical execution (Layer 2) by managing the delicate balance of Pain vs. Confidence.

The Tension of Pain: The system identifies deep-seated insecurities and incorrect beliefs. The execution logic deliberately creates understimulated and overstimulated moments to induce cognitive friction and frustration. This is the "Pain Investment"—making the prospect feel the unbearable weight of their current state.

The Release of Confidence: The system then resolves this tension by providing the "mechanism" or "proof." It gives the prospect the social and logical ammunition (the Reason) they need to confidently choose your solution.

The Final Execution: Every editorial cut, music swell, and copy transition is governed by this push-and-pull. The stimulation curve is engineered to dip into the pain of the problem and climax into the confidence of the resolution, ensuring the prospect doesn't just feel inspired, but is compelled to act.
